## 3 HTTP API Transaction

### 3.1 Transaction

The HTTP API Transaction starts from a request from a client Application, usually a web browser. The request is processed by the web server on the Dahua video products, then send the response back to the client application. The HTTP request is taken in GET form. If the request is successful, the Dahua video product will return a HTTP header contains 200 OK. The HTTP Body will contain actual data or error message if an error occurs.

For describe convenience, we use some short words to instead the long expressions. The follows are several regulations:

1. The italics and bold will be replaced by the value behind the symbol “=”.
2. The URL must follow the standard way of writing a URL.(RFC\_3986:Uniform Resource Identifiers (URI) Generic Syntax);that is ,spaces and other reserved characters (“;”, “/”, “?”, “:”, “@”, “=”, “+”, “,” and “\$”) within a <paramName> or a <paramValue> must be replaced with %<ASCII hex>.For example ,the blank must be instead with %20.
3. To describe the range of the configuration, we use some symbols such as “[]”, “{}” and so on. For example :”[0-100]” denotes a integer not less than 0 and not larger than 100. “{0,1,2,3}” denotes the valid value of a integer among 0,1,2 and 3.
4. In the request and response, we use “[ ]” to denote an array. The index is usually a integer and start form 0.
5. The parameter value has several types: string, integer, bool and float.Integer is 32 bits.The range of bool is “true” and “false”.

The below is an example of a transaction:

<b>Request</b>	<b>GET http://&lt;ip&gt;/cgi-bin/configManager.cgi?action=getConfig&amp;name=VideoColor</b>
----------------	---

<b>Description</b>	Get VideoColor configuration.
<b>Response</b>	HTTP/1.1 200 OK Content-Type:text/plain <b>head</b> .Brightness=50 <b>head</b> .Contrast=50 <b>head</b> .Hue=50 <b>head</b> .Saturation=50 <b>head</b> .TimeSection=1 00:00:00-24:00:00
<b>Comment</b>	In above table, <b>head</b> = table.VideoColor[ChannelNo][ColorConfigNo] ChannelNo = video channel index, colorConfigNo = color config index. 0 = Color Config 1 1 = Color Config 2 ... We can also request the single config. For example: <b>Request :</b> <b>GET</b> http://10.7.2.4/cgi-bin/configManager.cgi?action=getConfig&name=VideoColor[0][0].Brightness <b>Response:</b> HTTP/1.1 200 OK Content-Type:text/plain table.VideoColor[0][0].Brightness=50

## 3.2 Format

The format of CGI Description is below table:

<b>URL Syntax</b>	<a href="http://&lt;ip&gt;/cgi-bin/magicBox.cgi?action=getProductDefinition&amp;name=MaxExtraStream">http://&lt;ip&gt;/cgi-bin/magicBox.cgi?action=getProductDefinition&amp;name=MaxExtraStream</a>
<b>Description</b>	Get Max Extra Stream number of device
<b>Comment</b>	In below table, the range of table.MaxExtraStream is {1,2,3}
<b>Response</b>	table.MaxExtraStream=1

URL Syntax: the format of CGI, the Necessary param is between "<" and ">", unnecessary param is between "[" and "]"

Description: the description of this CGI.

Comment : the comment to params, including range of param , example for this cgi and so on.

Response: example for response of this CGI.

## 3.3 Authentication

The Dahua video product supplies two authentication ways: basic authentication and digest authentication. If the http request does not have "Authorization" , the Dahua video product returns 401, until the http request has a legal authentication .

For example:

#### 1. When basic authentication, the Dahua video product response:

401 Unauthorized

WWW-Authenticate: Basic realm="XXXXXX"

Then the client encode the username and password with base64, send the following request:

Authorization: Basic VXZVXZ.

#### 2. When digest authentication, the Dahua video product response:

WWW-Authenticate: Digest realm="DH\_00408CA5EA04", nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", stale=FALSE, qop="auth";

The client calculates the digest using username, password, nonce, realm and URI with MD5, then send the following request:

Authorization: Digest username="admin", realm="DH\_00408CA5EA04", nc=00000001, cnonce="0a4f113b", qop="auth", nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", uri="cgi-bin/global.login?userName=admin", response="65002de02df697e946b750590b44f8bf"

## 3.4 Response

When cgi response is failed, the answer's format is:

Error\n

ErrorID=<Error No.>, Detail=<Error Description>\n

For example:

Error\n

ErrorID=2, Detail=Forbidden\n

Error No. definition are as follows:

Table3-1 Error Code

错误码	错误描述	详细解释
0	Invalid Authority!	用户没有权限
1	Request parse error!	请求内容错误, 比如请求内容不全
2	Invalid Request!	请求非法
3	Method not found!	接口没找到, 不支持
4	Request invalid param!	请求带有的参数不合法
5	Server internal error!	内部错误
6	Request Timeout!	请求超时
7	Client keepalive failed!	客户端保活失败
8	Network error!	设备端网络错误

## 4 Camera

Camera API allows application to configure and view Dahua video product settings.

## 4.1 Stream

### 4.1.1 GetStream

URL Syntax	rtsp://<username>:<password>@<ip>:<port>/cam/realmonitor?channel=<channelNo>&subtype=<typeNo>
Comment	<p>&lt;username&gt;: a valid user's username.</p> <p>&lt;password&gt; :user's password.</p> <p>&lt;ip&gt; :the IP address of the Dahua video product.</p> <p>&lt;port &gt;:the default port is 554. It can be omitted.</p> <p>&lt;channelNo&gt; :the channel number. It starts from 1.</p> <p>&lt;typeNo&gt; :the stream type. The &lt;typeNo&gt; of main stream is 0, extra stream 1 is 1, extra stream 2 is 2.The extra stream counts can be obtained in <a href="#">4.1.2 GetMaxStreamCounts</a>. The stream must be enabled by setting <b>head.VideoEnable</b> to true in <a href="#">4.4.4 SetVideoEncodeConfig</a>.</p> <p>For example, we request the extra stream 1 of channel 1, the URL is: rtsp://admin:admin@10.7.6.67:554/cam/realmonitor?channel=1&amp;subtype=1.</p> <p>The IP Camera supports both TCP and UDP transmission forms.</p> <p>It also supplies basic authentication and digest authentication ways. The authentication process is similar with <a href="#">3.2 Authentication</a>.</p>

### 4.1.2 GetMaxExtraStreamCounts

URL Syntax	http://<ip>/cgi-bin/magicBox.cgi?action=getProductDefinition&name=MaxExtraStream
Response	table.MaxExtraStream=1
Comment	In above table, the range of table.MaxExtraStream is {1,2,3}

### 4.1.3 GetSnapshot

URL Syntax	http://<ip>/cgi-bin/snapshot.cgi? [channel=<channelNo>]
Response	A picture encoded by jpg
Comment	The channel number is default 0 if the request is not carried the param.

### 4.1.4 GetVideo

URL Syntax	http://<ip>/cgi-bin/mjpg/video.cgi?[channel=<channelNo>&subtype=<typeNo>]
Response	<p>video stream encoded by mjpg</p> <p>Return:</p> <p>HTTP Code:200 OK</p> <p>Content-Type:multipart/x-mixed-replace;boundary=&lt;boundary&gt;</p> <p>Body:</p>

	--<boundary> Content-Type:image/jpeg Content-Length:<image size>  <JPEG image data> --<boundary>
<b>Comment</b>	The channel number is default 0 if the request is not carried the param. Subtype: the stream type. The <typeNo> of main stream is 0, extra stream 1 is 1, extra stream 2 is 2.

Byte Order	0	1	2	3	4	5	6	...
Key	0x22	len		reserved	Title ...			

When a stream begin, or the device channel title changes, the video packet must contain the channel title extend header; If the channel title is Chinese, it only support utf8 format.

TimeZone Extend Header:

Byte Order	0	1	2	3	4	5	6	7
Key	0x31	8		reserved	Time Zone		Daylight saving time	reserved

When a stream begin, or the TimeZone changes, the video packet must contain the TimeZone extend header; Time Zone[0]: [-12,12](west time zone 12 to east time zone 12), Time Zone[1] modify the time by minutes; Daylight saving time: 1/0, yes or not in daylight saving time;
