3.HTTP API Transaction

3.1 Transaction

The HTTP API Transaction starts from a request from a client Application, usually a web browser. The request is processed by the web server on the Dahua video products, then send the response back to the client application. The HTTP request is taken in GET form. If the request is successful, the Dahua video product will return a HTTP header contains 200 OK. The HTTP Body will contain actual data or error message if an error occurs.

For describe convenience, we use some short words to instead the long expressions. The follows are several regulations:

1. The italics and bold will be replaced by the value behind the symbol “=”.
2. The URL must follow the standard way of writing a URL.(RFC_3986:Uniform Resource Identifiers (URI) Generic Syntax);that is ,spaces and other reserved characters (“;”, “/”, “?”, “:”, “@”, “=”, “+”, “,” and “\$”) within a <paramName> or a <paramValue> must be replaced with %<ASCII hex>.For example ,the blank must be instead with %20.
3. To describe the range of the configuration, we use some symbols such as “[]”, “{ }” and so on. For example :”[0-100]” denotes a integer not less than 0 and not larger than 100. “{0,1,2,3}” denotes the valid value of a integer among 0,1,2 and 3.
4. In the request and response, we use “[]” to denote an array. The index is usually a integer and start form 0.
5. The parameter value has several types: string, integer, bool and float.Integer is 32 bits.The range of bool is “true” and “false”.

The below is an example of a transaction:

Request	GET http://<ip>/cgi-bin/configManager.cgi?action=getConfig&name= VideoColor
Description	Get VideoColor configuration.
Response	HTTP/1.1 200 OK Content-Type:text/plain head .Brightness=50 head .Contrast=50 head .Hue=50 head .Saturation=50

	head .TimeSection=1 00:00:00-24:00:00
Comment	<p>In above table, head= table.VideoColor[ChannelNo][ColorConfigNo]</p> <p>ChannelNo = video channel index, colorConfigNo = color config index.</p> <p>0 = Color Config 1 1 = Color Config 2 ...</p> <p>We can also request the single config. For example:</p> <p>Request : GET http://10.7.2.4/cgi-bin/configManager.cgi?action=getConfig&name=VideoColor[0][0].Brightness</p> <p>Response: HTTP/1.1 200 OK Content-Type:text/plain table.VideoColor[0][0].Brightness=50</p>

3.2 Format

The format of CGI Description is below table:

URL Syntax	<a href="http://<ip>/cgi-bin/magicBox.cgi?action=getProductDefinition&name=MaxExtraStream">http://<ip>/cgi-bin/magicBox.cgi?action=getProductDefinition&name=MaxExtraStream
Description	Get Max Extra Stream number of device
Comment	In below table, the range of table.MaxExtraStream is {1,2,3}
Response	table.MaxExtraStream=1

URL Syntax: the format of CGI, the Necessary param is between "<" and ">", unnecessary param is between "[" and "]".

Description: the description of this CGI.

Comment : the comment to params, including range of param , example for this cgi and so on.

Response: example for response of this CGI.

3.3 Authentication

The Dahua video product supplies two authentication ways: basic authentication and digest authentication. If the http request does not have "Authorization", the Dahua video product returns 401, until the http request has a legal authentication .

For example:

1. When basic authentication, the Dahua video product response:

401 Unauthorized

WWW-Authenticate: Basic realm=" XXXXXX"

Then the client encode the username and password with base64, send the following request:

Authorization: Basic VXZVXZ.

2. When digest authentication, the Dahua video product response:

WWW-Authenticate: Digest realm="DH_00408CA5EA04", nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", stale=FALSE, qop="auth";

The client calculates the digest using username, password, nonce, realm and URI with MD5, then send the following request:

Authorization: Digest username="admin", realm="DH_00408CA5EA04", nc=00000001, cnonce="0a4f113b", qop="auth" nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", uri="cgi-bin/global.login?userName=admin", response="65002de02df697e946b750590b44f8bf"

3.4 Response

When cgi response is failed, the answer's format is:

Error\n

ErrorID=<Error No.>, Detail=<Error Description>\n

For example:

Error\n

ErrorID=2, Detail=Forbidden\n

Error No. definition are as follows:

Table3-1 Error Code

错误码	错误描述	详细解释
0	Invalid Authority!	用户没有权限
1	Request parse error!	请求内容错误, 比如请求内容不全
2	Invalid Request!	请求非法
3	Method not found!	接口没找到, 不支持
4	Request invalid param!	请求带有的参数不合法
5	Server internal error!	内部错误
6	Request Timeout!	请求超时
7	Client keepalive failed!	客户端保活失败
8	Network error!	设备端网络错误

4.Camera

Camera API allows application to configure and view Dahua video product settings.

4.1Stream

4.1.1 GetStream

URL Syntax	<code>rtsp://<username>:<password>@<ip>:<port>/cam/realmonitor?channel=<channelNo>&subtype=<typeNo></code>

12.Appendix

12.1 Stream Format

The Stream format is used by 4.1.7 GetStream By Http and 4.1.8 Playback By Http, describes the format of the data stream.

Stream Header:

Byte Order	0	1	2	3	4	5	6	7
------------	---	---	---	---	---	---	---	---

Key	Flag	Type	reserved	packet length
-----	------	------	----------	---------------

Byte Order	8	9	10	11	12	13	14	15
Key	channel		Extend header length		Sequence			

Byte Order	16	17	18	19	20	21	22	23
Key	utc				utcms		reserved	Check sum

Flag="DH";

Type=0x10 means the audio packet;

Type=0x20 means the video packet;

Packet length means the packet total length, contains the packet header, maybe one or more extend header, and the media data;

Extend Header Format

Byte Order	0	1	2	3	4	5	6	...
Key	Type	length		reserved	data			

Extend header length must be multiple of 4 bytes;

Audio extend header:

Byte Order	0	1	2	3	4	5	6	7
Key	0x11	8		reserved	Audio Type	Tracks	Sample Freq	reserved

A audio packet must contain the audio extend header;

Audio Type:1 - PCM8;2 - G729;3 - IMA_ADPCM;4 - G711U;5 - G721;6 - PCM8_VWIS;7 - MS_ADPCM;8 - G711A;9 - AMR-NB;10 - PCM16;11- G723.1;12 - AAC;13 - G726_40;14 - G726_32;15 - G726_24;16 - G726_16

Tracks: Tracks number, support 1 and 2;

Sample Freq: audio sample frequency,1 - 4000;2 - 8000;3 - 11025;4 - 16000;5 - 20000;6 - 22050;7 - 32000;8 - 44100;9 - 48000;

Video Extend Header:

Byte Order	0	1	2	3	4	5	6	7
------------	---	---	---	---	---	---	---	---

Key	0x21	16	reserved	Video Type	Frame Type	Width
-----	------	----	----------	------------	------------	-------

Byte Order	8	9	10	11	12	13	14	15
Key	Height	I Frame Interval	Frame Rate	reserved				

A video packet must contain the video extend header; Video Type means the video codec type, 1-MPEG4; 2-H.264; Frame Type: 1-I frame; 2-P frame; 3-B frame; Width and Height describe the frame width and height by pixel;

Channel Title Extend Header:

Byte Order	0	1	2	3	4	5	6	...
Key	0x22	len	reserved	Title ...				

When a stream begin, or the device channel title changes, the video packet must contain the channel title extend header; If the channel title is Chinese, it only support utf8 format.

TimeZone Extend Header:

Byte Order	0	1	2	3	4	5	6	7
Key	0x31	8	reserved	Time Zone		Daylight saving time	reserved	

When a stream begin, or the TimeZone changes, the video packet must contain the TimeZone extend header; Time Zone[0]: [-12,12](west time zone 12 to east time zone 12), Time Zone[1] modify the time by minutes; Daylight saving time: 1/0, yes or not in daylight saving time;

Event Flag Extend Header:

Byte Order	0	1	2	3	4	5	6	...
Key	0x23	len	reserved	Event Flag				

If the video frame contain one or more event flags, the video packet should contain the Event Flag Extend Header. The event flag means what event had happened by set the bit as 1;

Event Flag: bit0-exterior alarm; bit1-move detect; bit2-video lost.

13.1 AdjustFocus

URL Syntax	http://<ip>/cgi-bin/devVideoInput.cgi?action= adjustFocus &focus=<focus>&zoom=<zoom>
Comment	focus : float, the range is between 0 and 1; -1 means reset to position 0. zoom : float, the range is between 0 and 1; -1 means reset to position 0.
Response	OK or ERROR

13.2 AdjustFocusContinuously

URL Syntax	http://<ip>/cgi-bin/devVideoInput.cgi?action= adjustFocusContinuously &focus=<focus>&zoom=<zoom>
Comment	focus: float, the range is -1 < focus < 1; 0 means stop. zoom: float, the range is -1 < zoom < 1; 0 means stop. The value means the moving speed of motor lens, positive value means move forwards, negative value means move backwards. This command is used to drive the lens move continuously, until it reaches end. When motor is moving, and you send this command again with focus or zoom parameter as 0, the motor will stop immediately. In this command when you adjust the focus parameter, the zoom parameter should be -1, and the focus parameter should be -1 when adjust the zoom parameter.
Example	If we want to adjust focus, the API like this: http://172.30.1.100/cgi-bin/devVideoInput.cgi?action=adjustFocusContinuously&focus=0.02&zoom=-1 and when the motor is moving, we send below command to let it stop: http://172.30.1.100/cgi-bin/devVideoInput.cgi?action=adjustFocusContinuously&focus=0&zoom=-1
Response	OK or ERROR
